Array Challenge
Have the function ArrayChallenge(arr) read the arr parameter
being passed which will represent a full day and will be filled with events that
happened in that day (all events are in military time). Your program will have to
interpret the start time and end time of each event and then return the total
amount of time in minutes spent on events. For example: if arr is ["10:00AM-12:30PM",
"02:00PM-02:45PM", "09:10AM-09:50AM"] then your program should return 205 because
the first event lasted 150 minutes, the second event lasted 45 minutes, and the last
event lasted 40 minutes for a total of 205 minutes. The input will always be in
chronological order and will not have any overlapping events. For example: if arr is
["04:10AM-04:11AM", "04:00AM-04:01AM"] your program should return 2. The input will
contain at least 1 event and the events may be out of order.
Once your function is working, take the final output string and concatenate
it with your challengeToken and then replace every third character with
an X.
